

Environmental Policy

eMarine provides solutions to make vessels more energy efficient and environmentally friendly. Our unique technology and know-how are proven to significantly reduce GHG emissions and improve the carbon intensity rating. In essence, eMarine assists vessel owners to reduce their environmental footprint and achieve their energy targets, while at the same time participating in the global combat against climate change.

How we fulfill our policy

- We integrate green technology into every aspect of our product and service offering.
- Our commitment is to develop and implement green technology that not only meets, but exceeds, the recommendations set by the International Maritime Organization. To safeguard this commitment, a minimum of 5% of yearly revenues is distributed to R&D (stipulated in the owner's directive).
- Through our GPS technology, we take ownership by constantly monitoring our client vessels, to make sure the technology, beyond initial implementation, is calibrated to minimize energy and GHG emission.
- We constantly follow-up, evaluate and develop an environmentally friendly life cycle in our operations. We work to minimize our own and our client's environmental impact as far as it is justified, technically possible and economically reasonable:
- We strive to improve and ensure the competence development of all employees and contractors at eMarine, to contribute to an increased environmental mindset, which in turn contributes to an enhanced environmental competence development.
- We continuously monitor and comply with applicable environmental laws and other environmental requirements from stakeholders that affect our operations.
- To constantly improve our environmental work, we conduct continuous follow-up work and revised environmental goals and action programs.
